Research areas

- The experimental studies of rates and critical behavior of the magnetic, magnetostructural and metamagnetostructural phase transitions. The experimental methods assume measurements of achievable working frequencies of devices based on materials with phase transitions.
- The experimental studies of magnetocaloric effect in prospective materials under adiabatic and quasi-isothermal conditions in high magnetic fields including the new fiber-optical temperature probe with ultra-fast response (≈ 1 microsec).
- The experimental studies of new ferromagnetic Heusler alloys with shape memory effect. Possibilities to control the giant strains in polycrystalline ferromagnetic Heusler functional alloys during structural magnetic-field-induced martensitic phase transitions.
- The experimental studies of electromagnetic waves, which were emitted from solid materials at structural phase transitions in the frequencies range of 30 GHz. The possible mechanisms and theory of such effect were developed.
- The experimental studies of magnetic levitation and superconductivity in HTSC materials.
